

Threat Detection & Response — Fully Managed

Managed Detection and Response (MDR) pairs round-the-clock monitoring with real security engineers who investigate, contain, and close out every threat on your endpoints. You get the outcome — not another alert asking you to make the call.

WHAT IS MDR?

Managed Detection and Response blends continuous monitoring with hands-on security expertise to find, investigate, and remediate threats in real time. Rather than just flagging suspicious activity and handing it back to you, an MDR team actively hunts for what automated tools alone tend to miss and takes action to shut it down.

WHY IT MATTERS

- **Faster containment.** Threats are investigated and resolved as they happen, not queued for later review.
- **Less burden on your team.** No tickets landing in your inbox asking you to decide if something is safe.
- **Proactive, not just reactive.** Active threat hunting catches what signature-based tools alone miss.
- **Enterprise-grade expertise.** The security bench you'd otherwise have to hire, train, and staff around the clock.

HOW LMJ DELIVERS MDR

1

Monitor & Prioritize

Every endpoint we manage is watched continuously. When something fires, it's triaged the same day using a standardized decision framework that separates real threats from trusted, everyday software.

2

Threat Hunt & Investigate

Our engineers dig into scope and cause — what triggered the alert, what it touched, and whether it's a known-safe tool or something that needs to be shut down.

3

Contain & Remediate

Confirmed threats are quarantined or blocked immediately. Trusted software is cleared and access restored right away — no waiting on a refresh cycle, no action required from your team.

4

Resolve & Harden

Every incident is logged with a verdict and closed out, and what we learn gets rolled back into your protection — closing the loop and hardening your environment against what's next.

Full-service remediation. Zero security homework for your team.
